

Amazon India Sales Dashboard

Project Report

Project Type	Business Intelligence / Data Visualization
Tool	Microsoft Power BI
Focus	Sales, Profit, Products, Orders, Customer Order Status, Payment, Fulfilment and Geographic Performance
Report Layout	Single-page interactive management dashboard

1. Executive Summary

The Amazon India Sales Dashboard is an interactive Power BI solution created to turn sales data into a clear management view. It combines key performance indicators, trend analysis, product and category analysis, order-status monitoring, and payment, fulfilment, and geographic views in a single dashboard. The design focuses on quick understanding and practical business use rather than technical complexity.

2. Project Objective

The main objective of the project is to help management monitor business performance from one place. The dashboard is intended to make it easy to track sales and profitability, understand which products and categories perform well, monitor completed and lost orders, and compare business performance across payment methods, fulfilment methods, and states.

3. Tools Used

Microsoft Power BI was used to build the interactive dashboard and visualizations. **DAX** was used to create the main business measures and KPIs. **Microsoft Excel** was used as the source data file.

4. Dashboard Snapshot

The current dashboard view provides the following headline metrics when the report is viewed without restrictive slicer selections.

155.79M Total Sales	33.17M Total Profit	10K Total Orders	25K Total Units Sold
15.58K Average Order Value	21.29% Profit Margin	8K Delivered Orders	500 Cancelled Orders

5. Dashboard Design and Visual Analysis

Monthly Sales & Profit Trend

A line chart shows how sales and profit move across months. It helps the user compare monthly performance and notice changes in business activity.

Top 10 Products by Sales

A ranked horizontal bar chart highlights the highest-selling products. Supporting profit and quantity information is available through tooltips.

Category-wise Sales

A category comparison shows the relative sales contribution of each category. Hover details provide additional profit, quantity, and order information.

Category-wise Returns & Cancellations

This chart compares returned and cancelled orders across categories, helping management identify categories with higher order-loss activity.

Order Status

The donut chart shows the distribution of Delivered, Shipped, Returned, and Cancelled orders.

State Performance

The state-level chart compares sales across states, with supporting profit and order information available through tooltips.

Payment & Fulfillment Performance

A compact matrix compares total sales and total profit by payment method and fulfilment method.

6. Key Business Measures

Measure	Description
Total Sales	Total value of sales.
Total Profit	Total profit generated.
Total Orders	Total number of orders.
Total Units Sold	Total quantity sold.
Average Order Value	Average sales value per order.
Profit Margin %	Profit expressed as a percentage of sales.
Return Rate %	Returned orders relative to total orders.
Cancellation Rate %	Cancelled orders relative to total orders.

7. Interactivity

The dashboard includes slicers for **Year, Category, Order Status, Ship State, and Payment Method**. These filters allow users to focus on a specific period, product category, order status, state, or payment method. The visuals and KPI values update according to the selected filters, making the report useful for interactive exploration.

8. Business Use of the Dashboard

- Monitor overall sales and profit performance.
- Track monthly movement in sales and profitability.
- Identify top-selling products and stronger product categories.
- Understand delivered, shipped, returned, and cancelled orders.
- Review return and cancellation activity by category.
- Compare performance across payment and fulfilment methods.
- Identify stronger and weaker geographic markets through state-level analysis.

9. Key Takeaways

The dashboard brings multiple business perspectives together in a single, easy-to-read management view. The combination of KPI cards and interactive visuals supports both quick monitoring and deeper exploration. The report can be used to identify changes in performance, compare segments, and focus attention on areas that may require further analysis.

10. Conclusion

The Amazon India Sales Dashboard demonstrates how Power BI and DAX can be used to convert business data into an interactive reporting solution. The final dashboard focuses on clarity, usability, and decision support by combining core performance measures with product, category, order, payment, fulfilment, and geographic analysis. It provides a practical foundation for ongoing sales and performance monitoring.
